Condition: New. 4th new edition. Language: English. A brand new book. Behavioral research and practice strategies and tactics focus on the most effective methods of measuring and assessing behavioral changes. The authors provide justification for different procedures for measuring behaviour and developing within subjective comparisons between control and intervention. The text explains the strengths and weaknesses of methodological alternatives for each topic, so that behavioral researchers and practitioners can make better decisions in each situation. This classic text has been extensively revised to be more accessible and practical. It not only shows much more discussion about how research methods are relevant to today's practitioners, but also includes additional examples based on field research and service delivery scenarios. With expanded coverage to create experimental designs, as well as new chapters on behavioral evaluation, statistical data analysis, and ethical questions related to research methods, this book provides a strong framework for direct behavioral measurement, within the subject of design research, as well as interpretation of behavioral interventions. Enriched with more pedagogical features, including key terms, tables that summarize important points, numbers to help readers visualize text, and updated examples and proposed readings, this book is an invaluable resource for students taking courses in research methods. This book is suitable for researchers and practitioners in behavioral analysis, psychology, education, social work and other social and medical research programs that address behavior issues in research or practice settings. The readings presented in this volume are composed of previously published works and chapters by the authors, as well as from new written materials. At a more advanced level, the readings consider certain Themes. However, these statements are thematically consistent with the chapters in the accompanying volume, which makes them particularly appropriate as additional material. Together with his accompanying volume, he an integrated and consistent account of how to study behavior. Most of the topics covered in traditional study texts are detailed, in particular, referring to behaviour as a subject. However, the work differs from other texts in that its themes are organized not around the output of statistical methods, but the needs of the behavioral subject and the purpose of bringing the behavior of the researcher under their control. This approach closely integrates each new chapter with previous chapters, and the result is particularly intuitive for students.
